

Turn it on, midges gone!

Don't let those long summer days be ruined by those pesky midges, protect you and everyone around you with the Thermacell Zone Protector.

The clever technology eliminates the need for strong smelling candles and sprays, or sticky lotions on the skin. A Zone Protector will create a 20 metre squared space which will protect anyone (including pets!) inside it from mosquitoes and midges.

So how does it work?

The fuel-powered Thermacell technology uses heat activated repellent to create an invisible, scent-free, zone of protection. The devices are powered by a small butane cartridge which provides cordless, portable heat that is directed onto a metal grill. A small mat is saturated with allethrin, this is a synthetic copy of a natural repellent found in chrysanthemum plants. The mat is inserted on top of the metal grill and when heated, it creates the zone of protection.

Simple to use, simply insert the mat, insert the fuel cartridge and rotate the device to turn it on.

Recommended Retail Price: £34.99

The Thermacell technology is available in a variety of Protectors including the Halo Mini (pictured right) which is ideal for in the garden setting. Other units include the BackPacker, MR300 and camping lanterns.
